Video Workbook with Dr. B.

We use the Ideal Gas Law when conditions don't change and mass or moles (n) are involved.

$$PV = nRT$$

P is usually in atm, mmHg, or kPa.

V must be in Liters (L).

n will be moles (mol).

R will be $0.08206 \text{ L} \cdot \text{atm} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}$ when P is in atm.

R will be $62.364 \text{ L} \cdot \text{mmHg} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$ when P is mmHg.

R will be $8.314 \text{ J} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}$ when P is kPa.

T must be in Kelvin (K).

There are no 100% ideal gases, but many are close at higher temperatures and lower pressures.

 [Ideal Gas Law](#)

 [Gas laws playlist](#)

 [Real vs Ideal Gases](#)

 [When to Use the Ideal Gas Law](#)

Memorize **STP!**

Standard Temperature and Pressure

- 273.15 K
- 1 atm (or 760 mmHg).

When is a gas closer to ideal?

- The molecules/atoms do not attract or repel each other.
 - The atoms/molecules do not take up any space.
-  This is often at lower pressures and higher temperatures.

When is a gas less ideal (non-ideal)?

- At high pressure.
- At low temperatures.

Example 1

A sample of gas has a pressure of 2.0 atm, occupies a volume of 3.0 L, and contains 0.5 moles of gas. What is the temperature of the gas in Kelvin?

 [Video of worked solution.](#)

Example 1 Solution

$P = 2.0 \text{ atm}$
 $V = 3.0 \text{ L}$
 $n = 0.5 \text{ mol}$
 $T = ?$

Because P is in atm we use
 $0.08206 \text{ (L} \cdot \text{atm)} / \text{(mol} \cdot \text{K)}$ for R.

$$2.0 \text{ atm} * 3.0 \text{ L} = 0.5 \text{ mol} * 0.08206 \text{ (L} \cdot \text{atm)} / \text{(mol} \cdot \text{K)} * T$$

Solving for T we get 146 K.

Example 2

What is the temperature of a 0.500 mol sample of gas at 820.2 mmHg and a volume of 2.7L?

 [Video of worked solution.](#)

Example 2 Solution

$$\begin{aligned}P &= 820.2 \text{ mmHg} \\V &= 2.7 \text{ L} \\n &= 0.500 \text{ mol} \\T &= ?\end{aligned}$$

Because P is in mmHg we use
 $62.364 \text{ L} \cdot \text{mmHg} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$
Or convert mmHg to atm.

$$820.2 \text{ mmHg} * 2.7 \text{ L} = 0.500 \text{ mol} * 62.364 \text{ L} \cdot \text{mmHg} \cdot \text{K}^{-1} \cdot \text{mol}^{-1} * T$$

Solving for **T** we get 71 K.

Example 3

A sample of an ideal gas occupies a volume of 550 mL at 25°C. The pressure is measured to be 1.2 atm. What is the number of moles of the gas in the sample?

 [Video of worked solution.](#)

Note: 1L = 1000mL

Note: K = °C + 273.15

Example 3 Solution

$$\begin{aligned}P &= 1.2 \text{ atm} \\V &= 550 \text{ mL} = 0.55 \text{ L} \\n &= ? \\T &= 298.15 \text{ K}\end{aligned}$$

Because P is in atm we use
 $0.08206 \text{ (L} \cdot \text{atm)} / (\text{mol} \cdot \text{K})$ for R.

$$1.2 \text{ atm} * 0.55 \text{ L} = n * 0.08206 \text{ (L} \cdot \text{atm)} / (\text{mol} \cdot \text{K}) * 298.15 \text{ K}$$

Solving for **n** we get 0.027 mol.

Example 4

How many moles of gas are contained in 321 mL at 25.0 °C and 745 mmHg pressure?

Note: You can also convert mmHg to atm or use a value for R that has mmHg.

1 atm = 760 mmHg

 [Video of worked solution.](#)

Example 4 Solution

$$\begin{aligned}P &= 745 \text{ mmHg} \\V &= 321 \text{ mL} = 0.321 \text{ L} \\n &= ? \\T &= 298.15 \text{ K}\end{aligned}$$

Convert Pressure to atm or use
 $62.36367 \text{ (mmHg} \cdot \text{L)} / (\text{mol} \cdot \text{K})$ for R.

$$745 \text{ mmHg} * 0.321 \text{ L} = n * 62.364 \text{ L} \cdot \text{mmHg} \cdot \text{K}^{-1} \cdot \text{mol}^{-1} * 298.15 \text{ K}$$

Solving for **n** we get 0.0129 mol

Note: For problems where you solve for Pressure (P), the units for P will depend on the value of R you choose.

If R is:	P will be in:
$0.08206 \text{ L} \cdot \text{atm} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}$	atm
$62.364 \text{ L} \cdot \text{mmHg} \cdot \text{K}^{-1} \cdot \text{mol}^{-1}$	mmHg
$8.314 \text{ J} \cdot \text{mol}^{-1} \cdot \text{K}^{-1}$	kPa

Example 5

Determine the volume occupied by 2.34 grams of Carbon dioxide gas (CO₂) at 27.2°C and 2.2 atm.

 [Video of worked solution.](#)

Example 5 Solution

$$P = 2.2 \text{ atm}$$

$$V = ?$$

$$n = 2.34 \text{ g CO}_2 = 0.0531 \text{ mol}$$

$$T = 300.35 \text{ K}$$

$$2.2 \text{ atm} * V = 0.0531 \text{ mol} * 0.08206 \text{ (L}\cdot\text{atm)/(mol}\cdot\text{K)} * 300.35 \text{ K}$$

Solving for V we get 0.59 L

Example 6

Determine the volume of occupied by 32.0 grams of O₂ gas at STP.

 [Video of worked solution.](#)

STP is 273.15 K and 1 atm or 760 mmHg

Example 6 Solution

$$P = 1.0 \text{ atm}$$

$$V = ?$$

$$n = 32.0 \text{ g O}_2 = 1.0 \text{ mol}$$

$$T = 273.15 \text{ K}$$

$$1 \text{ atm} * V = 1 \text{ mol} * 0.0821 \text{ (L}\cdot\text{atm)/(mol}\cdot\text{K)} * 273.15 \text{ K}$$

Solving for n we get 22.4 L

So 1 mole of an ideal gas at STP is equal to 22.4 L.

The **molar volume** of a gas at STP is 22.4L.

Example 7

A chemical reaction occurs, producing an oxide of nitrogen (e.g. NO, NO₂, N₂O) as a gas. The gas has a mass of 1.211g and occupies a volume of 0.677L. The temperature in the laboratory is 296.0 K and the air pressure is 0.987atm. Calculate the molar mass of the gas assuming the gas is ideal.

 [Video of worked solution.](#)

Example 7 Solution

$$P = 0.987 \text{ atm}$$

$$V = 0.677 \text{ L}$$

$$n = ?$$

$$T = 296.0 \text{ K}$$

$$0.987 \text{ atm} * 0.677 \text{ L} = n * 0.08206 \text{ (L}\cdot\text{atm)/(mol}\cdot\text{K)} * 296.0 \text{ K}$$

Solving for n we get: 0.0275 mol.

We divide the grams in the problem by the moles we found to get **molar mass**:

$$1.211 \text{ g} / 0.0275 \text{ mol} = 44.04 \text{ g/mol}$$
