Video Workbook with Dr. B

Polyatomic ions are groups of non-metals bonded together to form an ion. You either memorize them, or if your instructor allows it, look them up on a [table of polyatomic ions](#).

Memorize these immediately.

Ammonium ion:  $\text{NH}_4^+$

Hydroxide ion:  $\text{OH}^-$

Nitrate ion:  $\text{NO}_3^-$

Carbonate ion:  $\text{CO}_3^{2-}$

Sulfate ion:  $\text{SO}_4^{2-}$

Phosphate ion:  $\text{PO}_4^{3-}$

## Keys to Naming Ionic Compounds with Polyatomic Ions

- Name the metal (the cation) as it appears on the Periodic Table.  
Na = Sodium      Al = Aluminum      Fe = Iron
- Find the polyatomic ion on the [list of polyatomic ions](#) and write the name.
- If there is a transition metal, write the charge of the metal in parentheses. E.g. Iron (III) chloride.

Note: It is possible to have two polyatomic ions such as  $\text{NH}_4\text{NO}_3$ . In this case find and write both names as found on the Common Ion Table.

Example ([video explanation](#)):  $\text{Na}_2\text{CO}_3$

- From the Periodic Table, Na is Sodium.
- Look up (or have memorized) that  $\text{CO}_3^{2-}$  is the Carbonate ion.
- The name for  $\text{Na}_2\text{CO}_3$  is Sodium carbonate.

Example ([video explanation](#)):  $\text{Fe}_3(\text{PO}_4)_2$

- From the Periodic Table, Fe is Iron.
- Look up (or have memorized) that  $\text{PO}_4^{3-}$  is the Phosphate ion.
- Determine the charge on the transition metal. For Iron it is 2+.
- The name for  $\text{Fe}_3(\text{PO}_4)_2$  is Iron (II) phosphate.

*This is one of the most effective ways to learn naming and formula writing.*

## Formula Writing for Ionic Compounds with Polyatomic Ions

We must consider the *ionic charge* on each element to write the formulas for ionic compounds.

### Keys to Writing Formulas for Ionic Compounds with Polyatomic Ions:

- Write the element symbol for the metal and its charge using Periodic Table.
- Find the name and charge of the polyatomic ion on the [Common Ion Table](#).
- See if the charges are balanced (if they are you're done!).
- Add subscripts (if necessary) so the charge for the entire compound is zero.
- Use the crisscross method to check your work.

Example ([video explanation](#)): Write the formula for Iron (III) phosphate

- From the Periodic Table, Iron is Fe.
- Look up (or have memorized) that  $\text{PO}_4^{3-}$  is the Phosphate ion.
- The charge for Iron (III) is  $3+$ .
- Since the  $3+$  and  $3-$  cancel out, we're done.
- The formula of Iron (III) phosphate is  $\text{FePO}_4$ .

Example ([video explanation](#)): Write the formula for Copper (II) phosphate

- From the Periodic Table, Copper is Cu.
- Look up (or have memorized) that  $\text{PO}_4^{3-}$  is the Phosphate ion.
- The charge for Copper (II) is  $2+$ .
- Use the criss-cross method to balance the charge for the compound.
- The formula of Copper (II) phosphate is  $\text{Cu}_3(\text{PO}_4)_2$ .
