

Balancing Equations with Dr. B

Video Workbook with Dr. B.

More guides at
www.breslyn.org

We balance equations to find the **ratios** of each substance in the equation.

When we balance equations, you can *only* change the coefficients. *Never* change the subscripts.

The goal is to have the same number of each type of atom on both sides of the equation.

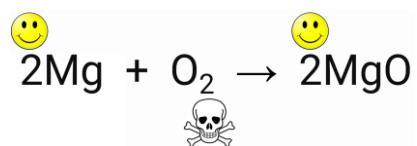

$\text{Na} = 2$	$\text{Na} = 2$
$\text{Cl} = 2$	$\text{Cl} = 2$

The equation is balanced because there are 2 Na atoms and 2 Cl atoms in the reactants. We also have 2 Na atoms and 2 Cl atoms in the products.

Watch this video, it may be all you need to learn to balance!

Remember only change the coefficients!

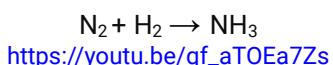

Practice with Video Explanations

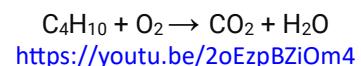

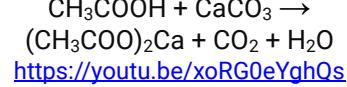

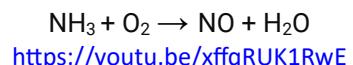

Easy

Medium

More Challenging

Answers Below:

H₂ + Cl₂ → 2HCl

(already balanced)
