To understand chemical bonding we try to visualize the arrangement of electrons and atoms.

## For bonding it's all about the valence electrons!

We need to understand how the behavior of valence electrons relates to the visible chemical and physical properties of substances.

## Key Terms

A **valence electron** is an electron in the highest energy level or an atom.

A **chemical bond** forms when valence electrons are transferred (ionic) or shared (molecular) between atoms.

Bonds are formed to fill atoms' highest energy level (often called an **Octet**). Noble gases have octets.

**Ionic Bond**—a strong bond between a metal cation (positive ions) and non-metal anion (negative ions)

**Ion**—atoms that have a charge (+ or -).

Lost electron = + charge = cation.

Gained electron = - charge = anion.

**Molecular (Covalent) Bond**—a semi-strong bond between two non-metals.
